# Close the Loop Global

Close the Loop scales their impact with CarbonSuite.

OBJECTIVE

Close the Loop Global (CTL) provides innovative sustainability solutions, including product stewardship, materials recovery, and the production of recycled-content products. As a leader in circular economy practices, CTL needs to validate and communicate the environmental impact of its operations with accurate, auditable data. With CarbonSuite, CTL was seeking a robust system to manage the increasing demand for sustainability disclosures across its global operations - spanning Australia, North America, South Africa, and Belgium. CTL required a single integrated system that could consolidate sustainability data across multiple diverse business units and geographies.

SOLUTION

CarbonSuite was implemented as CTL's centralized platform for sustainability data management, tracking emissions and other environmental data across all operations. The platform integrates directly with CTL's operational systems to automate data collection as much as possible. During implementation, we collaborated with logistics providers & travel partners to collect direct Scope 3 activity data, improving accuracy and traceability of reporting. Additionally, CTL now has the ability to integrate activity data used for other reporting like the Australian Packaging Covenant Organisation (APCO), which can be converted into emissions. These collaborations enable CTL to move beyond estimates and support its environmental claims with verifiable data.

BENEFITS

Centralized Sustainability Data Management

CarbonSuite provides CTL with a single source of truth for emissions, energy, and waste management data. This centralization eliminates redundant data handling and reduces the risk of inconsistencies across teams and regions. With CarbonSuite, CTL's sustainability team can now confidently manage and report on its full data set in one platform.

Optimized Process and Organizational Change Management

The implementation of CarbonSuite supports CTL in aligning internal teams and refining data collection processes. By engaging stakeholders across supply chain, logistics, and operations, CTL is embedding sustainability tracking into business-as-usual workflows. This minimizes disruption and creates long-term accountability for environmental data across the organization.

Streamlined Sustainability Reporting

CarbonSuite's built-in reporting features allows CTL to produce compliant and audit-ready emissions disclosures for major customers and investors. The ability to generate customized reports saves time and ensures that reporting deadlines are consistently met. As regulations evolve, CTL is now positioned to adapt quickly without reworking its entire data infrastructure.

"With CarbonSuite, we've automated our emissions accounting, including data collection, emission source mapping and emission factor selections and emissions calculations based on the GHG protocol, making our reporting for mandatory climate disclosures seamless and accurate.

The platform integrates directly with our existing NetSuite system, pulling in real-time data without the headaches of spreadsheets or manual entries."

"Another huge advantage of CarbonSuite is their incredible support team. From onboarding to troubleshooting, they've been responsive, knowledgeable, and genuinely invested in our success. If your organisation is looking to streamline emissions reporting and turn sustainability into a business advantage, I highly recommend CarbonSuite."

Krishna Suri
Sustainability Officer,
CTL Group
